Saw blade measurement

EZ 1000 saw blade measuring system

The new concept which provides two live images at the same time. Use of the series 6000 raster zoom systems and the corresponding angular optics allow us to show the saw tooth from the side and from the front (or by swivelling) from above at the same time and, using the Metric measurement software, to measure and document both windows in real time.

The system is designed for diameters from 50 mm to 1500 mm. The vertical take-up of the saw blades meant that it was possible to produce a space-saving basic design. The system can be screwed onto a tubular steel frame or where necessary screwed onto the wall. The take-ups for the saw blade guarantee a precise positioning of the saw blade which also allows the axial run-out of the blade to be controlled.

Excellent images, produced by high-quality optics together with perfect illumination allow rapid working in an ergonomic posture.

As an alternative the system is available without stand. The set includes the adjustment unit with two incremental zoom systems, the illumination units, consisting of two ring lights with diffusers and cold light source, as well as the Metric Plus software (see Metric function list).

If required we will send you a drawing with hole pattern for mounting the adjustment unit with optical equipment. After the customer has installed the system, we come to install the measuring software and provide the training. These services are included in the system price. With this version, the adapter and auxiliary lenses for the system

working range can be changed to upgrade the system for saw blades with a diameter of 2500 mm.

Order no.	Description	Price excl. VAT.
EZ-1000-OS	Complete optical system, however without tubular steel stand (Free updates via Internet download)	11,500.00 €
EZ-1000-MS	System price with mobile base frame (Free updates via Internet download)	On request
Delivery:	Incl. packaging, freight charges see www.m-service.de	
Payment:	30 days, net
